
OPERATIONS MANUAL

NEXXUS POS for Supermarkets

Setup, daily checkout, inventory, cash control and reporting

Everything a supermarket needs to run NEXXUS POS — from the first day of setup through to the nightly cash count. Written for owners, managers, supervisors and cashiers.

Edition 1.0 · August 2026

Applies to the NEXXUS POS web application (Supermarket layouts)

Contents

1 Before you begin

What NEXXUS POS is · roles in your store · what you need on site · plans and limits

2 Opening your account and first-time setup

Signing up · the setup wizard · signing in · the staff PIN

3 Configuring the store

Business details · tax and currency · receipts · choosing the supermarket layout · lane security · branches

4 Staff, roles and permissions

5 Building your product catalogue

Products and barcodes · categories · loose goods · importing · shelf labels

6 Buying stock: suppliers, orders and bills

7 Running the checkout lane

Opening the lane · scanning · quantities · weighed goods · discounts · hold and recall · taking payment

8 The weighing scale station

9 Cash control and end of day

10 Prices and promotions

11 Customers, credit and gift vouchers

12 Stock control after opening

13 Reports and the audit trail

14 Housekeeping: backups, plan and support

15 Troubleshooting

A Appendix A — Permission matrix

B Appendix B — Daily, weekly and monthly routines

C Appendix C — Cashier quick card

D Appendix D — Glossary

CHAPTER 1

Before you begin

What the system does, who uses which part of it, and what you need in place before the first sale.

1.1 What NEXXUS POS gives a supermarket

NEXXUS POS is a web-based point of sale. It runs in a browser on a till PC, laptop or tablet — there is nothing to install — and every till in every branch works from the same live catalogue, stock figures and price list.

The parts of the system a supermarket uses every day are:

The lane

A scan-first checkout screen built for speed: scan, take payment, print, next customer.

The catalogue

Products, barcodes, prices, tax status and stock on hand, shared by every till.

The scale station

Weigh loose goods, print a barcoded weight label, and let the lane scan it.

Cash control

Shift floats, payouts, blind counts and over/short at the end of every shift.

Purchasing

Supplier orders and purchase bills that receive stock and update cost prices.

Reporting

Daily sales, GCT/tax, category and hourly performance, staff and stock variance.

1.2 Who does what

PERSON	WHAT THEY NORMALLY DO IN NEXXUS
Owner / Admin	Sets up the business, tax, receipts and branches; creates staff; sees every report; manages the subscription.
Manager	Runs the floor: approves discounts and voids, closes other people's shifts, manages products, prices and purchasing, reviews reports.
Supervisor	Approves lane overrides, opens and closes shifts, handles refunds and voids.
Cashier	Opens a shift, sells, holds and recalls bills, closes their own shift.
Inventory clerk	Receives goods, counts stock, prints shelf labels, keeps the catalogue tidy.

1.3 What you need on site

- A reliable internet connection. The lane keeps working through short outages (see §7.13), but setup, reporting and gift vouchers need a connection.
- One PC, laptop or tablet per lane, running a current browser (Chrome or Edge recommended).
- A USB or Bluetooth **barcode scanner** configured as a keyboard wedge — that is, it types the barcode and presses Enter. This is the default for almost every scanner sold.
- A **receipt printer** (58 mm or 80 mm) installed as a normal printer on the till.
- For loose goods: a weighing scale at the deli/produce counter and a **label printer**, or a scale that prints its own EAN-13 weight-embedded labels.
- Optional: cash drawer, customer-facing display, second screen.

1.4 Plans and limits

Your subscription decides how many products, staff and branches you can have. A supermarket almost always needs **Professional** or **Enterprise** because of the catalogue size.

PLAN	PRODUCTS	STAFF	BRANCHES	INVOICES
Free (3-day trial)	25	2	1	50
Starter	100	5	1	500
Professional	500	15	3	5,000
Enterprise	Unlimited	Unlimited	Unlimited	Unlimited

NOTE

Only active products count towards the limit. Archiving discontinued lines frees space, and you cannot downgrade to a plan whose product limit is below your current count.

CHAPTER 2

Opening your account and first-time setup

From sign-up to a working till, in one sitting.

2.1 The setup wizard

New accounts are created at the sign-up page and walked through seven steps:

Account	Business Name, Your Name, Email Address, Password (at least 8 characters), accept the Terms & Conditions. This email becomes your login and receives all system mail.
Business	Phone Number, Business Address, Country and Timezone . The timezone drives every date and time on receipts and reports — set it correctly now.
Plan	Monthly or annual billing (annual saves 17%), then the plan. Every account starts on a 3-day free trial.
Payment	PayPal or card. Skipped entirely on the Free plan.
Setup	Create the owner's admin PIN (4–8 digits, entered twice). The owner becomes the first staff member with the Admin role.
Hardware	Register the tills, printers and scanners you already have, download drivers, or choose Just give me the app and do it later.
Launch	Confirmation, and a shortcut straight into the POS.

2.2 Signing in each day

- 1 Open the NEXXUS POS address in the browser and sign in with the business email and password. This is the **store login** — normally done once per device, and the till stays signed in.
- 2 Each member of staff then identifies themselves with their own **4–8 digit PIN**. Switching cashier does not require signing the store out — use [Switch User](#) in the header.

WHY TWO LOGINS

The store login proves the device belongs to your business. The PIN records who made each sale, approved each discount and counted each drawer. Never share PINs — the audit trail is only as good as the PINs behind it.

2.3 Add the till to the home screen

NEXXUS POS can be installed as an app from the browser menu (Install or Add to Home Screen). It then opens full-screen without browser tabs, which stops cashiers from wandering off to other sites and makes offline mode more reliable.

CHAPTER 3

Configuring the store

Everything in this chapter lives under the gear icon → [Settings](#). Work down the list once; after that you will rarely return except for prices and staff.

3.1 The order to do it in

Settings is divided into sections down the left: Business, Industry & Features, Receipt, Currency, Email, Notifications, Inventory, POS Security, POS Interface, Optional Modules, Payment Methods, QR Code, Admin Users, Automation, Integrations, Roles. For a supermarket, complete them in this order: **Business → Industry → Receipt (tax) → Currency → POS Interface → POS Security → Inventory → Notifications → Roles → Payment Methods**.

3.2 Business information

Business Name	Prints at the top of every receipt. Line breaks are respected, so a second line such as a branch name is fine.
Phone Number, Address	Receipt header.
GCT Registration Number	Printed on receipts and used by the GCT/Tax report.
Timezone	Controls the date and time on receipts and the cut-off for "today" in reports.
Business Logo	Upload a PNG or JPG, then set Logo size on receipts (40–250 px). Keep it small on 58 mm paper.

3.3 Industry & features

Set **Business Type** to Supermarket. This tunes the default receipt template and the feature flags offered elsewhere. Restaurant-only features (Tables, Kitchen) disappear from the menu.

3.4 Tax and receipts

Default Tax Rate	Your GCT/VAT percentage, e.g. 15.
Tax Mode	Tax Exclusive — tax is added on top of the shelf price at the till. Tax Inclusive — the shelf price already contains the tax, and the receipt shows how much of it was tax. Most supermarkets price inclusive; choose the one your shelf edge labels reflect.
Default Markup	Used to suggest a selling price from cost when you add products.
Receipt Paper Size	58 mm or 80 mm — must match the printer or receipts print wide or clipped.
Auto-print receipts	Prints silently the moment a sale completes. Essential on a busy lane.
Print receipt-number barcode	Prints a scannable barcode on the receipt so returns and reprints can be found by scanning.
Receipt Template	Choose the supermarket template.
Receipt Footer Message	Return policy, opening hours, thank-you line.

IMPORTANT

Changing **Tax Mode** after you have loaded prices changes what every product costs the customer. Decide before you import the catalogue.

3.5 Currency

Set the **Base Currency** (JMD by default). A **Secondary Currency** with an exchange rate can be shown alongside it — useful for tourist-area stores.

3.6 Choosing the supermarket layout

Under **POS Interface** the checkout screen can take one of several shapes. They are mutually exclusive — turn on exactly one:

LAYOUT	USE IT WHEN
Supermarket Layout (scan-only)	Every item has a barcode. There is no product grid at all, which keeps cashiers scanning instead of hunting. The fastest lane.
Supermarket Mode (with item name search)	Same lane, plus a search box that finds items by name, SKU or barcode — for damaged barcodes, loose goods and new lines. Recommended for most stores.
Hardware Store Layout	Trade counter with quotes and long item descriptions.
Retail Layout	Boutique-style grid with pictures.
Courier Layout	Parcel receiving and pickup.

After changing the layout, open **POS** again to see it.

3.7 Lane security (POS Security)

Supermarket Mode in this section is the anti-shrinkage control. With it on, a cashier must get a **manager, supervisor or admin PIN** before they can:

- reduce the quantity of a line,
- remove a line from the bill,
- clear the whole bill.

Increasing a quantity never needs approval. Discounts and price overrides always require a manager PIN, whether or not this setting is on.

RECOMMENDED

Turn this on. The most common till fraud is scanning goods, voiding lines after the customer has paid cash, and pocketing the difference.

Kiosk lock, elsewhere in settings, stops staff leaving full-screen mode without a manager PIN.

3.8 Inventory behaviour

Allow Overselling If on, the lane will sell an item whose stock shows zero. Supermarkets normally leave this **on** — a wrong stock figure should never stop a queue — and fix the count later.

Stock Method FIFO (first in, first out) or LIFO, used for costing.

3.9 Alerts and the daily digest

Under **Notifications** :

- **Daily Email Digest** — yesterday's trading summary to a chosen address at a chosen time.
Use **Send Test Email Now** to confirm it arrives.
- **Low Stock Alerts** — enable, set the recipient, the alert time and the **Low Stock Threshold**.
The system checks hourly and emails the buyer.

3.10 Branches and stations

Locations holds your branches. **New Location** captures Branch Name, Address and Phone. Each branch has its own Inventory tab and Transfer History; use **Init All Products** to give a new branch a stock row for every product.

There is no separate screen for tills. A cashier picks the **Station / Till Number** when opening their cash shift, which is what ties a sale to lane 1, 2 or 3.

3.11 Hardware register

My Hardware is an asset register: record each receipt printer, scanner, cash drawer, card reader, customer display, label printer and tablet with make, model, serial, purchase date and condition. The Driver Downloads tab keeps installer links per platform so a replacement till can be set up quickly.

CHAPTER 4

Staff, roles and permissions

Every action at the lane is tied to a PIN. Get this right and the reports tell you the truth.

4.1 Adding a member of staff

- 1 Go to [Staff](#) → [Add Staff](#).
- 2 Enter **Full Name**.
- 3 Enter a **PIN** of 4–8 digits. It must be unique across all staff — no two people may share one. Leaving the PIN blank when editing keeps the existing one.
- 4 Choose the **Role** (see the table below).
- 5 Tick **Can receive cash** for anyone who will hold a drawer.
- 6 Save. To restrict someone to certain branches, open [Branch Access](#) and tick the branches, marking one as Primary. Leaving all unticked means all branches.

When someone leaves, edit them and untick **Active** rather than deleting — their sales history stays intact.

4.2 The standard roles

ROLE	TYPICAL USE IN A SUPERMARKET
Admin	Owner and IT. Everything, including settings and staff.
Manager	Store manager. Everything except changing system settings and creating staff.
Supervisor	Floor supervisor. Sells, approves discounts, voids and refunds, opens and closes shifts.
Cashier	Sells, opens their own shift, views orders and customers. Cannot void or refund.
Inventory Clerk	Receiving and counting: full inventory access, reports, and the scale.
Accountant	Read-only across orders, inventory, reports and customers, plus exports.
View Only	Look, don't touch — for auditors and trainees.

Roles can be edited and new ones created under [Settings → Roles](#), where each permission is a tick box. Appendix A lists the full matrix.

CHAPTER 5

Building your product catalogue

The catalogue is the single biggest job in setting up a supermarket, and the one that decides how fast your lanes run.

5.1 What a product record holds

Name	What the cashier and the receipt see. Include size: Milk 1L, not Milk.
Barcode	The EAN/UPC printed on the pack. This is what makes the lane fast — every scannable item needs one.
SKU	Your own code. Useful for loose goods and store-packed items.
Category	Drives the Category Sales report and shelf reporting. Keep the list short and consistent.
Price	Shelf price. Whether tax is inside it depends on your Tax Mode (\$3.4).
Cost	Purchase cost, used for profit reporting. Updated automatically when you receive a purchase bill.
Attracts sales tax	Untick for zero-rated basics. The lane then prints those lines as tax-exempt.
Stock	Quantity on hand. Per branch when you use Locations.
Sold by weight	Turns the item into a loose good — see §5.4.
Selling unit / size	Optional label such as each, pack, 500g, shown on the receipt.

5.2 Importing an existing catalogue

Do not type thousands of products. [Products](#) → [Import](#) takes a CSV:

- 1 Download a template — a generic one, or the Loyverse or QuickBooks layout if you are moving from those systems.
- 2 Fill it in from your supplier price file or old system export.
- 3 Upload it. NEXXUS matches the columns automatically; check the mapping for name, price, category, barcode, SKU, stock, in stock and selling unit, and correct anything mismatched.
- 4 Import, then read the row-by-row result list and fix the rejects.

BEFORE IMPORTING

De-duplicate the file on barcode. Two products sharing one barcode will make the lane ask the cashier which one they meant — every single time it is scanned.

5.3 Categories

Categories power the Category Sales report and make the catalogue searchable. Aim for 15–30 (Produce, Meat, Dairy, Frozen, Bakery, Dry Goods, Beverages, Household, Personal Care, Baby, Pet, Tobacco...) rather than hundreds.

5.4 Loose and weighed goods

Anything sold by weight — meat, produce, deli, bulk rice — is set up as a normal product with **Sold by weight** turned on and a unit of lb, kg, oz or g. The price is the price per that unit. Two things then change:

- At the lane, choosing the item asks for a weight instead of a quantity, and the line reads e.g. 3.750 lb.
- At the scale station the item can be weighed and given a printed barcode label that the lane simply scans (Chapter 8).

5.5 Bundles and multi-buys

A product can be built as a **composite** — a hamper or a "three for" pack made of other products. Selling the bundle draws stock from the components. For simple date-limited price cuts, use Promotions (§10.2) instead.

5.6 Shelf and product labels

The printer icon on a product card opens [Print Label](#) : choose Small, Medium or Large, the quantity to print, and whether to show store name, price, category and the barcode number. A CODE128 barcode is generated; if a product has no barcode of its own, NEXXUS prints one based on the product number so it can still be scanned.

5.7 Watching for gaps

The Products page shows live **running low** and **out of stock** counts. Click either badge to list exactly which lines are affected, then edit or restock from there.

CHAPTER 6

Buying stock: suppliers, orders and bills

Two documents: an order is what you asked for, a bill is what arrived. Only the bill moves stock.

6.1 Suppliers

Create each supplier once with name, contact, phone, email, website, address and notes. Purchase documents then link to the supplier record, so **Payables** can show what you owe each one.

6.2 Raising a purchase order

- 1 **Products** → **Orders** tab → **New Purchase Order** .
- 2 Choose the supplier and add products with quantities, expected cost and tax.
- 3 Set the expected date and save as a draft; when you send it to the supplier, mark it **Sent**.

An order changes nothing in stock or accounts. It exists so you can check the delivery against what you ordered.

6.3 Receiving a delivery

- 1 **Products** → **Purchases** tab → **New Purchase Bill** (or convert the matching purchase order).
- 2 Enter the supplier's invoice number, date and lines — quantity received and the cost actually charged, with per-line tax if the invoice is taxed.
- 3 For perishables with batch tracking enabled, record the batch/lot number and expiry date.
- 4 Check the total against the supplier's invoice, then **Confirm & Receive** .

Confirming does three things: it **adds the goods to stock**, **updates each product's cost price**, and **raises the amount owed** in Payables.

GET IT RIGHT FIRST TIME

Confirm only when the delivery has been checked in. A confirmed bill has moved stock and money; correcting it afterwards is far more work than fixing a draft.

6.4 Returns to supplier

Damaged or short-dated goods going back to the supplier are recorded as a supplier return, which removes the stock and reduces what you owe.

CHAPTER 7

Running the checkout lane

This chapter is the cashier's chapter. Print Appendix C and tape it beside the till.

7.1 Getting the lane open

Opening **POS** presents up to two gates:

- 1 **Staff PIN Required** — the cashier types their 4–8 digit PIN.
- 2 **No Open Shift** — a full-screen message with **Open Shift in Cash Management**. No one can sell without an open cash shift; see §9.1.

With both cleared, the header shows Supermarket Mode and the station number, and the lane is ready.

7.2 The lane at a glance

Left — CURRENT BILL: the running list of items with Item, Qty and Amount. When empty it reads "Scan an item to begin."

Right — the scan box and keypad: the box is labelled **Scan or type SKU / barcode** (or **Search by name, SKU, or barcode** in search mode). Below it sit the number keypad, totals and the payment buttons.

Header buttons: **Add Customer**, **Hold**, **Recall** (with a badge showing how many bills are parked), **Clear**, **Dashboard**, reload, **Switch User**, **Lock**, and the X that closes the shift.

KEEP THE CURSOR IN THE SCAN BOX

The lane keeps focus in the scan box on purpose. If scanning stops registering, click once in the box and carry on.

7.3 Scanning

Scan the barcode; the scanner types it and presses Enter, and the item drops onto the bill. You can also type a barcode or SKU by hand and press Enter.

- **Unknown code** — "No product found." Try the item's SKU, or search by name if your lane has search mode. In search mode a genuinely new line can be added on the spot with **Add "..." as a new product**.
- **Two products share a barcode** — the lane asks which one; pick the right one and have the office fix the duplicate.
- **Search mode** — type part of a name and up to eight matches appear with barcode and price; click one to add it.

7.4 Quantities

Three ways, in order of speed:

- 1 **Multiple of the same item:** type the number on the keypad before scanning. The keypad shows × qty and the next scan is added that many times. Six tins: press 6, scan one tin.
 - 2 **Adjust a line:** use the + and – buttons on the line.
 - 3 **Set exactly:** tap the line to select it, key the number, press **Set Quantity**.
- C** clears the keypad and the backspace key deletes the last digit. Weighed lines show a fixed decimal quantity and have no +/- buttons — remove and re-add to change them.

7.5 Weighed goods at the lane

Scale label: scan the label printed at the deli or produce counter. It is an EAN-13 starting with 2 that carries the product and the weight, so the line arrives complete — no popup, no typing. Each label can only be sold once.

No label: select the loose product; the lane asks for the weight, then adds a line such as Beef Stew Cut — 3.750 lb.

TWO RULES FOR SCALE LABELS

A bill containing a scale label **cannot be held**. And if a label is removed from the bill, or the bill is cleared, the label is released and can be scanned again at another lane.

7.6 Price check

Price Check looks up any item without touching the bill or stock — scan or type the code and the screen shows the product, unit, size, the price in large type, and whether tax is included, added or exempt. Use it for shelf-edge queries mid-queue.

7.7 Attaching a customer

Add Customer searches by name, phone or email, or adds a new one on the spot. A customer is required for a **Credit** sale and for any remainder put on account in a split. Attaching a customer also builds their purchase history and loyalty record.

7.8 Discounts

- 1 Press **Discount**.
- 2 A manager, supervisor or admin enters their PIN on the Manager Override Required screen.
- 3 Choose **Percent** or **Fixed \$**, enter the value, press **Apply Discount**.

The discount shows in the totals with the approver recorded against it, and it is applied before tax. Remove it with the X. Held bills keep their discount when recalled. Every discount appears in the Discounts & Voids report — review it weekly.

7.9 Holding and recalling a bill

Customer forgot the milk? Press **Hold**. The bill is parked, the lane clears, and the next customer can be served. **Recall** lists the parked bills with their totals and item counts; tap one, confirm that it replaces what is on screen, and it comes back — discount and all.

Bills with scale labels or parcel pickups cannot be held.

7.10 Taking payment

Four buttons: **Cash**, **Card**, **Credit**, **Split**.

TENDER	HOW IT WORKS
Cash	Press Cash, then key what the customer handed over — or tap a quick button (exact amount, or the sensible rounded notes). Change Due is displayed in large type.
Card	Press Card and choose Debit or Credit ; the choice is required because it separates the two on your banking report. Take the payment on the terminal as usual, then complete the sale.
Credit	Puts the whole sale on the customer's account. A customer must be selected first, and the balance appears in Receivables.
Split	Opens a panel where you enter the card amount (with card type), the cash amount, and anything left over goes on account. Card plus cash may not exceed the total, and an on-account remainder needs a customer. The summary reads Tap to edit split.

7.11 Gift vouchers

Enter the code in the **Voucher code** box and press **Apply**. NEXXUS checks it is valid, not cancelled, not expired and has a balance, then shows the code, its balance, the amount applied and the amount still due. A voucher is a tender, not a discount: it pays part of the bill. If it covers everything, the payment buttons dim and the checkout button reads **CHECKOUT · Voucher \$...**. Otherwise take the remainder in cash or card as normal.

OFFLINE

Vouchers need a live connection — they cannot be validated or redeemed while the lane is offline.

7.12 Finishing the sale

Press the large **CHECKOUT · \$amount** button. It is blocked if the bill is empty, a split does not add up, a customer is missing for credit, or a card type has not been chosen.

Sale Complete then shows the order number, subtotal, tax and total — plus cash tendered and change due on a cash sale. **Print Receipt** reprints; **Done** clears the lane for the next customer. With auto-print on, the receipt is already coming out of the printer.

DOUBLE CHARGES

Every checkout carries a one-time reference, so a slow response, an impatient second press or a dropped connection cannot turn one sale into two.

7.13 When the internet drops

A banner appears: "You're offline — changes will sync automatically when your connection returns." The lane keeps serving from what it has already loaded and queues each sale. When the connection returns the queue is sent automatically and the banner clears.

- Do not close the browser or shut the till down while the banner is showing — the queue lives on that device.
- Gift vouchers are unavailable offline.
- Stock figures and prices are as they were when the connection dropped.

7.14 Refunds, voids and reprints

Completed sales live in [Order List](#). Find the order (scan the barcode on the receipt if you enabled it), then reprint the receipt, void it, or refund the whole sale or individual lines. Refunded stock goes back on hand automatically. Voids and refunds need the right permission — normally supervisor and above — and every one is listed in the Discounts & Voids report and the audit trail.

CHAPTER 8

The weighing scale station

Deli, butchery and produce: weigh once at the counter, scan at the lane.

8.1 Printing a weight label

- 1 Open **Weighing Scale**. Only products marked sold by weight appear here.
- 2 Find the item with **Search by name, barcode or PLU...**.
- 3 Put the goods on the scale and enter the weight — typed, keyed on the on-screen keypad, or sent straight from a USB scale.
- 4 Optionally set **Pack Date** and **Expiration Date** for fresh goods.
- 5 Press **Generate & Print Label**. The label prints with the weight, the price and a barcode.

8.2 Active labels

The **Active Labels** panel lists every printed label not yet sold, with its weight and total price. Each can be reprinted (if the sticker is damaged) or voided (if the goods went back). Labels disappear from the list once the lane sells them.

END-OF-DAY HABIT

Void the labels still showing at close for goods that were never sold, so tomorrow's list is clean.

8.3 Managing which products are weighed

Manage Products on the same page lets you search the catalogue and switch sold by weight and the unit on or off without leaving the counter.

CHAPTER 9

Cash control and end of day

A shift is the accounting unit of the lane: one cashier, one drawer, one count.

9.1 Opening a shift

- 1 Open **Cash Mgmt** and identify yourself with your PIN.
- 2 Choose the **Branch/Location** and the **Station / Till Number**, then Continue.
- 3 Count the float into the drawer and enter it as the **opening cash**. Submit.

The lane unlocks. The active shift panel shows Opening Cash, cash sales, payouts and **Expected Cash**, calculated as Opening + Cash Sales – Payouts.

9.2 Money leaving the drawer during the shift

Any cash taken out — paying a supplier, petty cash, a bank drop — is recorded with **Add Payout** : the amount and a **reason**, which is required. Payouts are listed on the shift and subtracted from expected cash. Cash coming in is simply the cash you take in sales.

9.3 Closing the shift

- 1 Press **Close Shift** .
- 2 Count the drawer and enter what is actually there. Enter the denomination breakdown (notes and coins) if your store requires one, then **Confirm & Close** .
- 3 The screen shows **Expected from System** against **Actual Cash Counted** and the difference — over or short.

The count is entered before the variance is settled, so cashiers cannot count "towards" the expected figure. Investigate anything beyond your tolerance the same day, while people still remember the shift.

9.4 Manager close and stuck shifts

A manager or admin can close a shift for a cashier who has gone home — the close dialog shows an admin banner. If a till crashed mid-shift and the shift will not close, an admin can use **Force Close Stuck Session** .

9.5 The end-of-day report

After closing, the EOD detail breaks the shift down — cash sales, card, credit, split components, voucher takings, refunds, payouts, opening float and expected cash. **Print EOD Report** for the cash bag, or download it for the office.

CHAPTER 10

Prices and promotions

Move a whole category's prices in one pass, and run date-limited specials without touching the base price.

10.1 Bulk price updates

- 1 Open **Price Manager** → Bulk Update.
- 2 **Pick what to update:** **All Products** , **By Category** or **Specific Products** .
- 3 Choose the adjustment: a percentage, a markup on cost, or a fixed amount.
- 4 Choose rounding — none, or to the nearest \$5, \$10, \$50, \$100 or \$1000 — so shelf prices stay tidy.
- 5 Press **Preview changes** and read the old-versus-new list carefully.
- 6 Apply. Every change is written to the History tab with who did it and when.

10.2 Promotions

Promotions → **New Promotion** : pick the product, the promo price and the start and end date-and-time. The list shows the regular price struck through beside the promo price, and whether the promotion is upcoming, active or expired. While it is active the lane charges the promo price automatically; when it expires the price returns on its own with no action needed.

CHAPTER 11

Customers, credit and gift vouchers

11.1 Customer records

Customers holds name, phone, email, address and notes, each with a loyalty card number, purchase history and account balance. Customers can be created at the lane while serving.

11.2 Selling on account

A **Credit** sale (or the on-account leg of a split) posts the amount to the customer's balance in **Receivables**, where you can see who owes what and record payments as they come in. Only sell on account to customers you have agreed terms with.

11.3 Gift vouchers

Gift Vouchers issues and manages vouchers: each has a code, a balance, and an optional expiry, and can be cancelled. Redemption happens at the lane (\$7.11). A voucher can be spent across several visits until the balance runs out, and a refund can be issued as a new voucher rather than cash.

CHAPTER 12

Stock control after opening

12.1 Counts and adjustments

Stock drifts — breakage, theft, miskeyed deliveries. Count a section at a time (a full-store count means closing the doors) and post the count so the system figure matches the shelf. Every adjustment records the staff member and reason, and the Stock Variance report shows where the losses are concentrated.

12.2 Multi-branch stock

With Locations in use, each branch carries its own stock figures and its own Transfer History. Moving goods between branches is recorded as a transfer with From Branch, To Branch, Product, Quantity and Notes — never as an adjustment at both ends, which loses the audit trail.

12.3 Batches and expiry

Where batch/expiry tracking is enabled, purchase bills capture the lot number and expiry date, which is what lets you find affected stock quickly in a recall and rotate short-dated goods.

12.4 Low stock in practice

Combine three things: the running-low badges on the Products page for a quick look, the emailed low-stock alert for the buyer's morning routine, and the Inventory and Product Sales reports for what actually sells.

CHAPTER 13

Reports and the audit trail

Every report takes a date range: Today, Yesterday, Last 7 Days, Last 30 Days or a custom From/To. Many can be exported to CSV.

REPORT	WHAT IT ANSWERS
Daily Sales	Orders, gross, subtotal, tax and discount for each trading day.
Payment Methods	How customers paid — cash, card, credit, split, voucher.
Product Sales	Units and value by product. Your best and worst sellers.
Category Sales	Performance by department — produce against grocery against household.
Hourly Sales	Trade by hour of day. Use it to roster cashiers where the queues actually are.
Inventory	Stock on hand and its value.
Stock Variance	Counted against expected. The shrinkage report.
Staff / Sales by Staff	Sales, items and averages per cashier.
Discounts & Voids	Every discount, void and who approved it. Review this weekly.
Profit Snapshot	Margin based on cost prices.
GCT / Tax	Tax collected, laid out for filing. Exportable.
Service Fee	Service charge totals where used.
Register Report	Managers and admins: cash, card, credit, split, refunds, payouts, opening float and expected cash per register. Printable.

13.1 Audit trail

Audit Trail records who did what and when across the system — price changes, voids, refunds, setting changes, staff edits. When a figure looks wrong, start here.

CHAPTER 14

Housekeeping: backups, plan and support

14.1 Backups

Backup exports a copy of your business data and can restore it. Take a backup before any bulk operation — a large import, a bulk price change, a catalogue clean-up.

RESTORES REPLACE

A restore replaces your current data with the backup's contents. Use it deliberately, not as an undo button for a single mistake.

14.2 Subscription and add-ons

Plan shows your subscription, renewal date and paid add-ons, and is where you upgrade when the catalogue or staff list outgrows your plan.

14.3 Getting help

Support holds step-by-step guides and raises a ticket with the NEXXUS team. Include the till, the time and the order number — it turns a day of back-and-forth into one reply.

CHAPTER 15

Troubleshooting

SYMPTOM	WHAT TO DO
Scanning does nothing	Click into the scan box to restore focus. Still nothing: scan into a text box elsewhere to confirm the scanner types and presses Enter; re-seat the USB or re-pair Bluetooth.
"No product found"	The barcode is not on any product. Add it to the product record (Products → find the item → edit the barcode), or sell by SKU/name search meanwhile.
The lane asks which product every time	Two products share that barcode. Fix the duplicate in Products.
"No Open Shift"	Nobody has opened the drawer for this till. Cash Mgmt → open a shift with the float.
Cashier cannot remove a line	Working as designed with Supermarket Mode security on — a manager, supervisor or admin PIN is required.
Discount button asks for a PIN	Always the case. Discounts need managerial approval and the approver is recorded.
Scale label will not scan	Check the label is not already sold or voided, and that the barcode is not creased or smudged. Reprint from Active Labels.
Weight item cannot be held	Correct — bills containing scale labels cannot be parked. Complete or clear the sale.
Receipt prints tiny, wide or cut off	Receipt Paper Size in Settings does not match the printer (58 vs 80 mm), or the browser print dialog has the wrong paper size selected.
Receipts do not print automatically	Turn on Auto-print receipts (silent printing) and allow the browser to print without a dialog for this site.
Offline banner will not clear	The device has no connection. Check the network; the queued sales send themselves once it returns. Do not close the browser.
Cash count is short	Check payouts were all recorded with reasons, look for voids after payment in the Discounts & Voids report, and check the audit trail for the shift.
Cannot add a new product	You are at the plan's product limit. Archive discontinued lines or upgrade the plan.
Stock figure is obviously wrong	Count the section and post an adjustment; then check whether the delivery was received as a confirmed purchase bill.

APPENDIX A

Permission matrix

The standard roles and what they may do. Roles are editable under Settings → Roles; Admin and Owner always bypass every check.

PERMISSION	ADMIN	MANAGER	SUPERVISOR	CASHIER	INV. CLERK	ACCOUNTANT
Sell at the POS	✓	✓	✓	✓		
Void a sale	✓	✓	✓			
Apply a discount	✓	✓	✓	✓		
Refund	✓	✓	✓			
Open the cash drawer	✓	✓	✓	✓

APPENDIX B

Daily, weekly and monthly routines

Opening the store

- Sign in on each till and confirm the lane loads.
- Each cashier opens a shift with a counted float, on their own station number.
- Check the printer has paper and prints a test receipt.
- Read the overnight low-stock alert and start the day's ordering.

During the day

- Record every cash removal as a payout, with a reason, as it happens.
- Receive deliveries as purchase bills the same day they arrive.
- Void unsold scale labels rather than leaving them active.

Closing the store

- Every cashier closes their shift with a counted drawer; investigate variances now, not tomorrow.
- Print or download the EOD report for the cash bag.
- Glance at Daily Sales and Payment Methods against the money in hand.

Weekly

- Read the Discounts & Voids report line by line.
- Count one or two sections and post adjustments.
- Check Category Sales and Hourly Sales for rostering and space decisions.
- Confirm supplier bills are entered and Payables matches the statements.

Monthly

- Export the GCT/Tax report for filing.
- Review Profit Snapshot and Stock Variance by department.
- Take a backup, and archive products you no longer stock.
- Review staff, roles and PINs — remove leavers.

APPENDIX C

Cashier quick card

Print this page and keep it at the lane.

TO DO THIS	DO THAT
Start selling	Enter your PIN → open a shift with the counted float → choose your station.
Add an item	Scan it. Or type the barcode/SKU and press Enter.
Six of the same item	Press 6 on the keypad, then scan one.
Change a quantity	+ / – on the line, or tap the line, key the number, Set Quantity .
Loose goods	Scan the scale label. No label? Select the item and enter the weight.
Check a price	Price Check — it does not touch the bill.
Customer nips back for an item	Hold , serve the next customer, then Recall .
Discount	Discount → call a manager for the PIN → percent or fixed → apply.
Remove a line	X on the line — a manager PIN may be required.
Cash	Cash → key what they handed you → read Change Due → checkout.
Card	Card → Debit or Credit → take payment on the terminal → checkout.
Part cash, part card	Split → enter each amount → checkout.
Gift voucher	Enter the code → Apply → take the remainder as normal.
Reprint a receipt	Print Receipt on the Sale Complete screen, or find the sale in Order List.
Step away	Lock . Handing over? Switch User .
Finish your shift	Close Shift → count the drawer → enter the total → confirm.
Screen says offline	Keep serving. Do not close the browser. It will sync on its own.

APPENDIX D

Glossary

Bill / current bill	The sale in progress on the lane screen.
Blind count	Counting the drawer before seeing what the system expects, so the count is honest.
Composite	A product built from other products — a hamper or multipack.
EAN-13 weight label	The barcode printed by a scale, starting with 2, carrying the product and its weight.
Float	The change put in the drawer at the start of a shift.
Held bill	A sale parked so the lane can serve someone else.
Override	A manager PIN authorising something a cashier may not do alone.
Payout	Cash taken out of the drawer for a reason other than change.
PLU	Price look-up code, used to find loose goods quickly.
Purchase bill	A supplier invoice recorded in NEXXUS. Confirming it receives stock.
Purchase order	What you asked the supplier for. Moves no stock.
Shift / cash session	One cashier's drawer, from float to final count.
Shrinkage	Stock lost to theft, damage or error — visible in Stock Variance.
Station	The till number chosen when a shift is opened.
Tax inclusive / exclusive	Whether the shelf price already contains GCT, or has it added at the till.
Tender	A way of paying: cash, card, credit, voucher.
Variance	The difference between expected and counted — over or short.

NEXXUS POS — Supermarket Operations Manual · Edition 1.0 · August 2026. Screens and labels described here reflect the Supermarket layouts of the NEXXUS POS web application.
